Cancer of the Lung

Anatomic Alterations of the Lungs
- Inflammation, swelling, and destruction of the bronchial airways and alveoli
- Excessive mucus production
- Tracheobronchial mucus accumulation and plugging
- Airway obstruction
  - Blood
  - Mucous accumulation
  - Tumor projecting into a bronchus

Anatomic Alterations of the Lungs
- Atelectasis
- Alveolar consolidation
- Cavity formation
- Pleural effusion

Etiology
- Lung cancer is the leading cause of cancer deaths in the United States
- More than 214,000 new cases are reported in the United States annually
  - About 114,000 in males
  - About 100,000 in females

Types of Cancer
- Non–small-cell cancer (NSCLC)
  - Squamous cell carcinoma
  - Adenocarcinoma
  - Large-cell carcinoma (Undifferentiated)
- Small-cell lung cancer (SCLC)
  - Small-cell (or oat cell carcinoma)
Cancer of the Lung

Screening and Diagnosis

• Routine chest x-ray is the most common
• Computed tomography (CT) scan
• Positron emission tomography (PET) scan
• View a tissue sample (biopsy) under a microscope—used for a definitive diagnosis

Screening and Diagnosis

• Procedures used to obtain a tissue biopsy
  – Bronchoscopy
  – Thoracoscopy
  – Mediastinoscopy
  – Transbronchial needle biopsy
  – Open-lung biopsy
  – Sputum cytology
  – Thoracentesis
  – Video thoracoscopy

Staging of Lung Cancer

• Staging is the process of classifying information about cancer
  – Cancer type
  – Size of the tumor
  – Level of lymph node involvement
  – The extent to which the cancer has spread
• The patient’s prognosis and treatment depend on the staging results

Staging of Lung Cancer

System most often used for staging lung cancer

• TNM classification
  – T represents the extent of the primary tumor
  – N denotes the lymph node involvement
  – M indicates the extent of metastasis
• Roman numerals are used to identify stages
  – 0 being the least advanced
  – IV being the most advanced

<table>

Cancer of the Lung

Staging of lung cancer by the TNM classification system.
A. Stage I disease includes tumors classified as T1, with or without metastasis to the lymph nodes in the ipsilateral hilar region.
B. Also included in stage I are tumors classified as T2 but having no nodal or distant metastases.
C. Stage II disease includes those tumors classified as T2, with metastasis only to the ipsilateral hilar lymph nodes.
D. Stage III includes all tumors more extensive than T2 or any tumor with metastasis to the lymph nodes in the mediastinum or with distant metastasis.

Non–Small-Cell Cancer Staging

• Small-cell cancer is staged differently than non–small–cell cancer
• Usually classified as
  – Limited: cancer confined to only one lung and to its neighboring lymph nodes
  – Extensive: cancer has spread beyond one lung and nearby lymph nodes. It may have invaded both lungs, more remote lymph nodes, or other organs

Overview of the Cardiopulmonary Clinical Manifestations Associated with Cancer of the Lung
Clinical Data Obtained at the Patient’s Bedside

The Physical Exam

• Vital Signs
  – Increased
    • Respiratory Rate
    • Pulse
    • Blood pressure
  – Cyanosis
  – Cough, sputum production
  – Chest assessment
    • crackles, rhonchi, wheezing

Clinical Data Obtained from Laboratory Tests and Special Procedures

Pulmonary Function Tests

• Relative to where the malignancy originates, the PFT values may show either obstructive or restrictive values
  – when the malignancy obstructs major airways, the PFTs may show obstructive pathology—especially when there is COPD present
  – when large amounts of pulmonary tissue, and/or diaphragm is involved (extensive bronchioalveolar carcinoma), then the pathology may show restrictive PFT values

Arterial Blood Gases

• Localized (e.g., lobar) Lung Cancer
  – Acute Alveolar Hyperventilation with Hypoxemia

\[
\begin{align*}
\text{pH} & \uparrow \\
\text{PaCO}_2 & \downarrow \\
\text{HCO}_3^- & \downarrow \\
\text{PaO}_2 & \downarrow 
\end{align*}
\]
RSPT 2310
Cancer of the Lung

Arterial Blood Gases

- Extensive or Widespread Lung Cancer
  - Acute Ventilatory Failure with Hypoxemia

  \[
  \begin{aligned}
  \text{pH} & \downarrow \\
  \text{PaCO}_2 & \uparrow \\
  \text{HCO}_3 & \uparrow \\
  \text{PaO}_2 & \downarrow 
  \end{aligned}
  \]

Oxygenation Indices

\[
\begin{aligned}
\text{Q}_S/Q_T & \uparrow \\
\text{DO}_2 & \downarrow \\
\text{VO}_2 & \downarrow \\
\text{C(a-v)O}_2 & \uparrow \\
\text{O}_{2\text{ER}} & \uparrow \\
\text{SvO}_2 & \downarrow 
\end{aligned}
\]

Hemodynamic Indices

- When hypoxemia and acidosis are present, or when a tumor invades the mediastinum and compresses the superior vena cava

\[
\begin{array}{ccccccc}
\text{CVP} & \uparrow & \text{RAP} & \uparrow & \text{PA} & \downarrow & \text{PCWP} & \downarrow \\
\text{CO} & \downarrow & \text{SV} & \downarrow & \text{SVI} & \downarrow & \text{CI} & \downarrow \\
\text{RVSWI} & \downarrow & \text{LVSWI} & \downarrow & \text{PVR} & \downarrow & \text{SVR} & \downarrow \\
\end{array}
\]

Radiographic Findings

- Chest Radiograph
  - Small oval or coin lesion
  - Large irregular mass
  - Alveolar consolidation
  - Atelectasis
  - Pleural effusion
  - Involvement of the mediastinum or diaphragm
Radiographic Findings

- CA of lung is often first diagnosed on a routine PA
- Depending on length of growth, the CXR may show a small radiodense nodule (coin lesion) or large irregular mass
- By the time most tumors are seen they have become invasive and are hard to treat
- Most common CXR presentation is a loss of lung volume
**PET scan:** axial view. A “hot spot” is further confirmed in left lower lung lobe.

**Clinical Manifestations**
- Clinical manifestations may be caused by
  - local effects
  - tumor extensions into mediastinum
  - paraneoplastic endocrine syndromes
  - tumor metastasis
- Most common local symptoms
  - cough
  - chest pain
  - dyspnea
  - hemoptysis

**Non-respiratory Clinical Manifestations**
- Hoarseness
- Difficulty in swallowing
- Superior vena cava syndrome
- Weakness
- Distention of the neck veins
- Neck and facial edema
- Electrolyte abnormalities

**General Management**
- **Surgery**
  - Wedge resection (partial removal of a lung lobe)
  - Segmentectomy (removal of a lung segment or segments)
  - Lobectomy (removal of one lung lobe)
  - Bilobectomy (removal of two lung lobes)
  - Pneumonectomy (removal of whole right or left lung)

- **Chemotherapy**
  - General term for any treatment involving the use of chemical agents or drugs that are selectively destructive to malignant cancer cells

**A**, Bronchoscopic view of a tumor protruding into the right mainstem bronchus.

**B**, A wire stent is in place to help hold the airway open (black arrow).
General Management

• Radiation Therapy
  – External radiation is often given with chemotherapy
  – May be used with curative intent in patients with non-small cell lung carcinoma who are not eligible for surgery

Supportive Care

• Radiation therapy and chemotherapy may not be tolerated when the patient has extensive small-cell lung cancer and is in poor health
• The patient may choose to receive only comfort or palliative care, which means treating the symptoms of the cancer rather than the cancer itself

Respiratory Protocols

• Oxygen Therapy Protocol
• Bronchopulmonary Hygiene Therapy Protocol
• Lung Expansion Therapy Protocol
• Aerosolized Medication
